Office Action Summary	Examiner	Art Unit			
	Danton DeMille	3764			
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply					
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).					
Status					
1) Responsive to communication(s) filed on	<u>-</u> ·				
2a) ☐ This action is FINAL . 2b) ☒ This	action is non-final.				
3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is					
closed in accordance with the practice under E	x parte Quayle, 1935 C.D. 11, 45	i3 O.G. 213.			
Disposition of Claims					
4) ☐ Claim(s) 21-50 is/are pending in the application 4a) Of the above claim(s) is/are withdraw 5) ☐ Claim(s) is/are allowed. 6) ☐ Claim(s) 21-50 is/are rejected. 7) ☐ Claim(s) is/are objected to. 8) ☐ Claim(s) are subject to restriction and/or	n from consideration.				
Application Papers					
9) The specification is objected to by the Examiner. 10) The drawing(s) filed on is/are: a) accepted or b) objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.					
Priority under 35 U.S.C. § 119					
 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) All b) Some * c) None of: 1. Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received. 					
Attachment(s) 1) Notice of References Cited (PTO-892) 2) Notice of Draftsperson's Patent Drawing Review (PTO-948) 3) Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date	4) Interview Summary Paper No(s)/Mail Da 5) Notice of Informal P 6) Other:				

Art Unit: 3764

DETAILED ACTION

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 21-50 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-18 of U.S. Patent No. 6290662.

Although the conflicting claims are not identical, they are not patentably distinct from each other because it would have been obvious to leave out the details of the pressure sensor and program the electrical circuitry to perform any desired method of therapy desired. Claim 21 is broader than those of the patent and therefore is anticipated by the patent claims. Every limitation in claim 21 has already been recited in the patent claims. There is no unobviousness to leave out limitations so as to not be so limited. If a claimed invention in the application is obvious over a claimed invention in the patent, there would be an unjustified extension of the patent and an obvious-type double patenting rejection is proper. See MPEP 804.

Application/Control Number: 09/954,759 Page 3

Art Unit: 3764

Claim Rejections - 35 USC § 112

Claims 38-42 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

It would appear that claims 38-44 recite the very same limitations as claims 24-28. Claim 24 recites everything in claim 38 including the controller operative to perform the function to inflate the bladder to a level of compression for a period of time after which the bladder deflates and operative to reduce the rate of cycling between compression and decompression as a function of time. These claims would appear to be redundant.

Claim 45 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

It would appear that claim 45 recites the very same limitations as claim 22. Claim 45 recites everything in claim 22 including the controller operative to vary the level of compression as a function of time. These claims would appear to be redundant.

Claim 48 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

It would appear that claim 45 recites the very same limitations as claim 23. Claim 45 recites everything in claim 23 including the controller operative to vary the onset of decompression as a function of time. These claims would appear to be redundant.

Art Unit: 3764

Claim Rejections - 35 USC § 103

Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Taheri '458 in view of Arkans '961.

Taheri teaches a flexible fabric outer shell, an inflatable/deflatable bladder A-D supported between the inner wall of the outer shell and the human limb and column 4, lines 49-53, teach "[t]he compressor 66 is a small portable battery operated pump, and the electronics 70, 71 and 72 consist of a microcircuit which has very small volume and weight. The foregoing features thus enhance the portability of the device." Clearly Taheri teaches all of the structure recited but appears silent with regard to whether or not the fabric outer shell is inelastic or not. Column 3, lines 35-38 state, "when the bladders are inflated, they will bulge inwardly toward the adjacent soft tissue to provide good pressure against the deep veins." In order to achieve the best result of directing the expansion of the bladders inwardly toward the adjacent soft tissue to provide good pressure against the deep veins it is well know to provide some degree of hardness or resistance to expansion of the outer layer to direct most of the expansion inwardly. A lot of the force of expansion would be lost if the outer layer is also elastic allowing the bladder to expand outwardly. This would not be most efficient and would be counter productive contrary to the teaching of Taheri.

Arkans '961 exemplifies the art of inflatable bladders having an "outer cover sheet 36 may comprise a relatively inelastic fabric" (column 2, lines 55-56). "The inelastic cover sheet 36 of the placed sleeve restricts the size of the inflated chambers, and greatly enhances the compressive action of the chambers to permit lower fluid volumes during the compression cycles." (column 5, lines 29-33)

Art Unit: 3764

It would have been obvious to one of ordinary skill in the art to modify the cover of Taheri to be inelastic as taught by Arkans to greatly enhance the compressive action of the chambers to permit lower fluid volumes during the compression cycle.

Claims 22, 23, 29, 30, 32, 33, 34, 37, 45, 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 21 above, and further in view of Lina '237. Taheri uses a program memory 72 for controlling the inflation operation of the bladders. The inflatable bladders are inflated in a desired sequence provided by the program memory. The only difference between the dependent claims and Taheri is the functional intended use parameters of operation. The dependent claims merely recite operating the device using varying the levels pressure or varying the rate of cycling, for example. All of these operational parameters are dependent on practical considerations of intended use. Not every patient requires the same intensity or length of application. There appears to be no unobviousness to modify the programming to accommodate a specific patient or specific type of treatment. Clearly the program memory of Taheri is capable of sequencing the inflation of the bladders as desired. It is only a matter of storing the desired steps in the program memory. It would appear to be well within the realm of the artisan of ordinary skill to find the optimum level of compression, timing, rate of cycling or any operational parameter to achieve the best treatment for a particular therapy for a particular patient.

Lina teaches varying the level of compression as a function of time in column 20, lines 5-13, "Upon system start-up, the initial pressure in the first inflate mode is low because the inflate solenoid valve is only briefly energized (25 milliseconds in the preferred embodiment). During each subsequent inflate mode, the inflate solenoid valve energization time increases by 25

Art Unit: 3764

milliseconds until that energization time reaches the operator selected or default pressure level, and the foot pump is delivering the desired pressure to the patient's foot." Therefore the pressure level in each subsequent cycle is being increased resulting in a ramping feature to reduce patient alarm by allowing the patient to gradually become acclimated to the pressure pulses. It would have been obvious to one of ordinary skill in the art to further modify Taheri to operate the controller to vary the level of compression as a function of time as taught by Lina to gradually increase the pressure so that the patient can become acclimated to the pressure pulses.

Regarding claims 23, 48, with each increase of inflate time this would then vary the onset of the decompression. Each iteration of inflation increases the inflation period 25 milliseconds therefore the onset of the decompression would also be pushed back 25 milliseconds. This would appear to comprehend claims 23, 48.

Regarding claim 29, Lina includes pressure sensors 40(A) to assure pressure within the bladder reaches the desired maximum pressure.

Claims 24-28, 38-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 21 above, and further in view of Zheng et al. '226. As noted above there is no unobviousness to find the optimum operating parameters for a particular type of treatment for a particular type of patient. The specific timing and pressures are well known variables that the registered practitioner varies all of the time. There is no criticality to any one specific method. The computer memory of Taheri is capable of holding any program desired. Zheng teaches that the cycle of inflation and deflation "may be repeated or varied according to the change of the time interval between square waves (55) and (56) as well as between square wave (58) and the first square wave (51') in the next cycle." (column 10, lines

Art Unit: 3764

32-37) This teaches that the time interval after deflation of all cells (58) and before inflation of the next cycle (51') can be varied rather than have the same time period repeated every time. It would have been obvious to one of ordinary skill in the art to further modify Taheri to vary the rate of cycling between compression and decompression as a function of time as taught by Zheng including increasing or reducing the cycle rate dependent on the type of therapy desired or condition of a particular patient.

Page 7

Regarding claims 25-27, 39-41, reducing the rate to be one cycle every several minutes or several hours is well within the realm of the artisan of ordinary skill through routine experimentation for a particular patient or finding the optimum results for a particular therapy and over the course of several days.

Regarding claims 28 and 42, Zheng teaches the cycle may be repeated or varied.

Providing an automated means in which to be able to switch between the two functions would have been an obvious provision in Taheri.

Claim 31 is rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 21 above, and further in view of Vinmont. Vinmont teaches the convention of using the inflatable bladder system inside a cast. There is no unobviousness to the intended use of the system. Vinmont exemplifies another conventional alternative outer shell formation. It would have been obvious to one of ordinary skill in the art to further modify Taheri to use in combination with a cast as taught by Vinmont since the art of improving cardiocepital venous flow applies to people in cases who are likewise ambulatory as well as taught by Vinmont.

Claims 35, 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over the

Art Unit: 3764

references as applied to claim 21 above, and further in view of Corcoran. Corcoran teaches the convention of stimulating the hand as well as the foot. It would have been obvious to one of ordinary skill in the art to further modify Taheri to use the device for the hand as well as the foot as taught by Corcoran for those people who need to stimulate circulation of those limb extremities.

Claim 36 rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 21 above, and further in view of Johnson, Jr. et al. '262. It would have been obvious to one of ordinary skill in the art to further modify Taheri to use a rigid outer shell as taught by Johnson as an obvious equivalent alternative form of the cuff.

Claims 43 and 44 are rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 38 above, and further in view of Lina '237. As noted above, it would have been obvious to one of ordinary skill in the art to further modify Taheri to operate the controller to vary the level of compression as a function of time as taught by Lina to gradually increase the pressure so that the patient can become acclimated to the pressure pulses.

Claims 46,47, 49 are rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claim 45 above, and further in view of Zheng et al. '226 As noted above there is no unobviousness to find the optimum operating parameters for a particular type of treatment for a particular type of patient. The specific timing and pressures are well known variables that the registered practitioner varies all of the time. There is no criticality to any one specific method. The computer memory of Taheri is capable of holding any program desired. Zheng teaches that the cycle of inflation and deflation "may be repeated or varied according to the change of the time interval between square waves (55) and (56) as well as between square

Art Unit: 3764

wave (58) and the first square wave (51') in the next cycle." (column 10, lines 32-37) This teaches that the time interval after deflation of all cells (58) and before inflation of the next cycle (51') can be varied rather than have the same time period repeated every time. It would have been obvious to one of ordinary skill in the art to further modify Taheri to vary the rate of cycling between compression and decompression as a function of time as taught by Zheng including increasing or reducing the cycle rate dependent on the type of therapy desired or condition of a particular patient.

Regarding claims 47, 50, Zheng teaches the cycle may be repeated or varied. Providing an automated means in which to be able to switch between the two functions would have been an obvious provision in Taheri.
